1. Field of the Invention The present invention relates to an improved process for the chemical conversion of methacrolein to methacrylic acid. More particularly, the present invention relates to a process for preparing methacrylic acid by reacting methacrolein with hydrogen in the presence of a catalytic amount of a mixture of palladium and carbon supported on a silica carrier.

2. Description of Related Art Methacrolein is produced from a variety of sources including natural gas and refinery by-products. Methacrolein is a versatile intermediate chemical which can be converted to methacrylic acid, a well-known compound useful as a monomer for preparing polymers such as polyester, polyurethanes, polyvinyls and polycarbonates. A conventional route for preparing methacrylic acid is by the catalytic reaction of aqueous hydrogen peroxide with propylene in the presence of a nickel catalyst. This reaction is generally carried out in a series of reactors, each containing a fixed bed of catalyst,

to allow for a continuous production process. The general reaction process involves first the preparation of
