Q: Change background color of UIButton using codes I want to change the background color of a UIButton dynamically. In my app, I am assigning a CGSize in the beginning and increasing/decreasing the height and width of the button and hence, changing the bkgd color. But in that process it's not taking effect on the UIButton. I have tried to change the bkgd color by using `[myButton setBackgroundColor:[UIColor redColor]]`; and `UIButton *myButton = [UIButton buttonWithType:UIButtonTypeCustom]`; but it is not changing the color.

A: Try this. //Change Button's backgroundcolor
`UIButton *button = [UIButton buttonWithType:UIButtonTypeCustom]`; `[button setBackgroundColor:[UIColor redColor]]`; //Change Button's frame
`CGRect frame = button.frame`; `frame.size.height = frame.size.height+10`; `[button setFrame:frame]`;

Q: Do I use less if the page only contains a single block? Let's say that I'm writing my own template for Drupal 7. There is no content on the page. Do I use and then HTML for the stylesheet, or can I just print out for the image?

A: If I were to get rid of the header and footer code, that would be a job for CSS. However, if it's just a simple block in the template that you

don't need to format, I would just use `print render($content);`. So you're just printing the content for the block, and are not using any CSS. Of course, you could also break the page into blocks and print out different blocks, but that's not what you're asking about. Q: Static vector classes are not global? As I understand it, a vector class (either `std::vector` or `std::weak_ptr`) is not global.
