More particularly, the present invention relates to a new method for synthesizing homogeneous, non-porous, metal-free organo-chromium(III) compositions which are particularly useful in the treatment of chromium-containing compositions and processes. These compositions are particularly useful in the treatment of metal-containing compositions and processes. These compositions are particularly useful in the treatment of chromium-containing compositions and processes. Chromic acid is an important material in many chemical processes, but its use has been limited due to its high cost. Chromic acid is also hazardous to handle and transportation, and it requires special treatment during disposal. Organo-

chromium(III) compounds are known as useful in the oxidation of organic materials. For example, U.S. Pat. Nos. 4,517,306 and 4,918,211 teach the use of iron-chromium(III) peroxides for oxidizing organic compounds, such as carbon monoxide and hydrogen, respectively. U.S. Pat. No. 4,968,341 teaches the use of iron-organo-chromium(III) complexes for oxidizing carbon monoxide. U.S. Pat. No. 5,024,899 teaches the use of chromium-organo-sulfur compounds to produce cyclopentene. For use in the oxidation of organic materials, however, the chromium-organo-sulfur compositions are not particularly useful because the resulting compounds are heterogeneous in nature and they have a non-porous structure. As a result, the compositions have a limited usefulness in the oxidation of organic materials.
