Educating for health: children's health. This paper sets out to explore the effect of health education upon health, the nature of health problems that would be best dealt with by health education and the issue of who should conduct this work. A literature review shows that health education, particularly in schools, is consistently associated with improvements in knowledge and behaviour. The real question, however, is, what is it that is being educated? In the first part of the paper, the authors describe current research which deals with the nature of health problems, particularly those in children, and the many interventions that are currently being developed to improve children's health. In the second part of the paper, attention is drawn to the conceptualisation of health and the current development of health education. Health education is seen as a generic term that encompasses a broad range of methods of intervention, both cognitive and behavioural. This broadening of health education in recent times reflects a more sophisticated approach to the understanding of health. It has been argued that the health of the whole community is the key objective for all those concerned with the improvement of community health and this paper adds weight to this argument. Finally, the authors consider the issue of who should conduct health education and question whether there should be a distinct role for health workers in the community./# \* Hibernate Search, full-text search for your domain model \* \* License: GNU Lesser General Public License (LGPL), version 2.1 or later \* See the lgpl.txt file in the root directory or 2d92ce491b
