

GEOrient Portable is a package designed to work with a digital topographic map. This application permits the representation of the geological structural characteristics in a two dimensional (2D) graphic to provide a simple geostatistical representation of the area. It is possible to create stereographic projections, rose diagrams, and other representations of the geological structures in a two dimensional graphic format. It is also possible to explore the structure of the land by setting up a certain configuration of stereographic projections to simulate the effect of reading a map or, for example, by exploring the rock structure with a rose diagram. GEOrient Portable is able to read the geological structural data from ASCII and ESRI Shape files. The extension to binary files will be added shortly. In addition, the tool can save the data as ASCII files or export as a multipoint (MULP) file compatible with ArcView. There is no need for reclassification of a data set since the application is designed to work with points in a regular grid that is distributed according to the regional morphology. However, it is possible to use a map and select the points manually if there is some uncertainty in the points. The navigation tool in GEOrient Portable works with ArcView and it is possible to navigate to a specific point by clicking with the mouse cursor on the map of the region and then dragging the mouse to the selected point. Another tool allows to zoom in and out the 3D projection of the geological structural data. GEOrient Portable Key Features: Create and edit a new KML file with the points defined in a grid Create a new Map Projection with the points defined in a grid in a selected database Import the GPS coordinates from files or enter the coordinates manually Create a new Marker from points in a grid. Create maps using a list of GPS coordinates or on other files Recognize and label points with text and symbology from a database Create a rose diagram (fractal diagram) Create a stereographic (four point) projection of the geological structural characteristics Create a map showing the geological structural characteristics by allowing the user to select the type of projection. Select a Region (E): I. Region 2D Landscape: A. Projections: 1. Horizontal projection - North

GEOrient Portable is a very practical tool that allows you to: - Create stereographic maps (both rose diagrams and inverted maps) using the Map of the World (WGS84) as the Base grid. - Visualize different parallel or antropolmeridional orientations in a rose diagram. - Import the data from ASCII files that store the geological data in both XY and XYZ formats - Generate orthographic maps (XY grid and Mercator projection) - Use the data for GIS analysis - Convert the data from one spatial reference system to another. Supported raster data formats: • Mercator projection and projection parameters are fully configurable • Support of all current USGS digital data formats - Cartesian raster and pseudo-raster - ASCII files and XYZ files for all the USGS digital data formats. - G.C.H. (converted from ASCII) - GeoTiff - GeoCyrille - ArcGIS.gdb files Windows 7 (32-bit) | Windows 7 (32-bit) | Windows 7 (64-bit) | Windows 8, Windows 8.1 | Windows 10 (32-bit) | Windows 10 (32-bit) | Windows 10 (64-bit) | Windows 10 IoT | Windows Server 2016 | Windows Server 2016 Standard | Windows Server 2016 Core | Windows Server 2012 R2 | Windows Server 2012 Core | Windows 8, Windows 8.1 | Windows 10 GEOrient Portable Windows version 1.7.1 Updates for GEOrient Portable - Added support for more GSHHS (United States Geological Survey, 1989) files - Added support for USGS ASCII files - Added support for B-trees to the file format - Improved the import/export of data files - Improved accuracy of the loaded Cartesian grid and improved accuracy in the XYZ projection - Improved accuracy of the inverted Cartesian maps - Added support for the calculation of ellipsoids - Added EGS260 ellipsoid as default ellipsoid - Fixed bugs and improved performance Windows 7 (32-bit) | Windows 7 (32-bit) | Windows 7 (64-bit) | Windows 8, Windows 8.1 | Windows 10 (32-bit) | Windows 10 (32-bit) | Windows 10 (64-bit) | Windows 10 IoT 6a5afdab4c

GEORient Portable is an Eroiectrical Structure generator, uses functions for the 3D visualization of the cross sections of the data and is able to:

- Generate cross sections of faults, fractures or beds and also indicate their azimuths
- Create Vectorial diagrams to show the direction of deviation and the density of the structure
- Generate rose diagrams to represent the geometry and orientation of the structures

The main functions of this software are:

- Data import: you can import the data from ASCII files or you can enter the data manually
- Data export: you can export the structure to be visualized in.CSV format and/or to PDF for the wide distribution or you can export it to the.TIFF format or.ARC for some specialized applications
- Layout of the cross sections on the plane or 3D: you can design the cross sections depending on the geological phenomena or you can import from other applications
- Orientation of the structures in the plane with the possibility to export it to other applications
- 3D visualization: for the 3D analysis you can use the visualization of the structures in the planar or 3D (orthographic and or perspective) depending on the requirements and requirements

Features of GEORient Portable:

- The layout of the structures can be modified and limited by the user in order to solve the geological problems and the representation of the structures can be created on any type of substrate from the Earth's crust to the Earth's magnetosphere (Earth plates, arcs, faults, fracture zones, sinter lines, flow of the primary ambient currents, etc.)
- The 3D structures can be viewed and analysed in two different types of projections: orthographic and perspective.
- A 3D mouse is used in order to show the three dimensional orientation and its possible orientation in any direction in any type of substrates and for any type of problem. See also Intergraph

External links Category:Earth sciences Category:Geophysics Category:Geoprocessing Category:Geological toolsQ: Project not found when trying to import the project from history I have a Typescript project that I exported as a NuGet package in Visual Studio. The package is in the same solution. The package has 1.0

What's New in the GEORient Portable?

GEORient Portable is a Quick Info Tool designed to deal with structural data stored in ASCII and ASCII layers so you can export the data or visualize the structure of the geologic model directly from the tool.

System Requirements:

High end system OS: Windows 7/8 CPU: i7-3930K @ 4.6GHz Memory: 6GB Video card: Nvidia GTX 770 @ 1GB DirectX: Version 11.1 Sound card: Nvidia X-Fi Fatal1ty Gaming Headset Additional Notes: Download link and patch HERE Overview "Ironman" is a VR inspired mission, combining the two VR genres of racing and first-person shooting together. You can drive the tank
