Unlike other CAD applications, AutoCAD did not replace the paper drafting process, but rather aimed to complement it. The first commercial version of AutoCAD, version 1, lacked nearly all of the features present in today's AutoCAD versions. The year 1994 saw the first release of AutoCAD LT, a version of AutoCAD suitable for a narrower, more price-sensitive market. Later in the same year, AutoCAD was available for the Macintosh. This release is still bundled as part of the AutoCAD Basic program, which still contains all of the original features of AutoCAD 1.x. Since this time, the main development of AutoCAD has been centered on the Windows platform. A smaller, lower-cost version of AutoCAD named AutoCAD 2000 was released in 1995, which was updated in 1998 and released again in 2000, featuring a new price. From this time onwards, a new version of AutoCAD became available every three years. The three-year release cycle made AutoCAD an attractive tool for small and medium-sized businesses. In 2012, the AutoCAD technology was ported to the iPad. About AutoCAD AutoCAD is one of the most common computer-aided design (CAD) applications worldwide. It is the main product of Autodesk. For each boot, the filesystem is mounted and I'm checking the dates of files, which are stored on an NFS partition, to see if any of the files are older than 2 weeks. If a file is older than 2 weeks, I want to either recover the file from the NFS server, or mount another filesystem to do the recovery. The filesystem on the NFS partition is ext4. The problem I'm facing is that I can't find a reliable way to figure out what filesystem this is (perhaps due to the fact that it's an embedded device). Every time I try to figure out what filesystem it is, it fails. So, if it is in fact a filesystem that I need to recover, I can't tell what kind of filesystem it is. When I run fdisk -l I get the following output: Disk /dev/sda: 3221MB, 32211052352 bytes 255 heads, 63 sectors/track, 4608 cylinders, total 786432000 sectors Units = sectors of 1 * 512 = 512 bytes Sector size (logical/physical): 512 bytes / 512 bytes I/O size (minimum/optimal): 512 bytes / 512 bytes Disk identifier: 0x000885e1 Device Boot Start End Blocks Id System /dev/sda1 * 1 786429 5871152 83 Linux /dev/sda2
