I liked the concept of the front channel (the center channel) so much, that I created another setup with the same effect, but for the center speaker. Aug 25, 2010 I have a limited amount of space and so my setup is going to be simple. I will. I'd rather not use the side ch, as it has not good mid and high frequency range and that channel will only be used for the main bass. I also already have. iZotope's Alloy is a completely configurable and self-contained software suite that contains six essential sound-shaping effects. Used on individual tracks or. Aug 14, 2012 iZotope has released Alloy 2, a forward-thinking mixing suite that combines six essential tools in one self-contained and completely. The Alloy family of mixing products has been discontinued. Effective March 2, 2017, Alloy 2 is no longer available for purchase. It has a very natural sound. The digital EQ has a very neutral sound. Between these two types, you can handle just about anything you need in a mix. As far as. I figured out that I could replace the Volume Meter with 4 track level meters. One for stereo (left, right), one for the center channel (track 3), one for the side channel (track 4), and one for the sub (track 5). That way I can see at a glance, if I need to boost the center for vocals, or the track level for a drum track. Or if the song is mostly vocals, it doesn't sound too high. And as for the Metering, I can still use the dropdown arrows and color them in to get a decent volume readout - even on the main screen! And I can also easily "zoom in" so I can get the full view of the 16 channels (the ones that are not visible when in regular view). I can also zoom out so I see the full view of the entire screen in one pic! Now I am a happy camper
