Mydoom is a virus that destroys files and cripples computers. It can take over or destroy the Windows Registry and can also take down a computer's security. It is an example of a self-replicating worm that can affect multiple computers at once. Description: This document describes the problem and a proposed solution in the case of an application failure of the type "Failed to load the JVM." This document was developed by Jessy Morand and Pascal Le Ruyet and it has been adapted by the folks at PacketFence. If you are interested in how PacketFence handles JVM errors, this document provides an overview. Description: This document provides the details of the problems that can occur in a JVM when opening a file using the "BufferedInputStream." The document describes how they could be created and analyzed using Java VisualVM. Description: The purpose of this article is to give the novice Java programmer some exposure to the Java and .Net architecture. This document describes a very simple application and how it uses Java. It is suggested that beginners learn the concepts of the following topics: Classes and Constructors, Inheritance, Class Loaders, Generics, Interfaces, Enums, Recursion, and the use of Annotations. Description: This document is intended to help a novice Java programmer understand the necessary steps to create a JSP Page. This document provides an example and then goes through the basics of what must be done to create a basic JSP page. The tutorial provides the additional information and support a Java Newbie would need in order to learn how to create a JSP Page. Description: This document describes the typical problems encountered when using an event-driven I/O-based programming model. One example is the BufferedReader class. The class has a buffer, and the buffer is read by the underlying operating system, not the Java Virtual Machine (JVM). This means that the underlying operating system (OS) often has to read data from the buffer at a much slower rate than the Java Virtual Machine (JVM) could read the data from the buffer. The reader class (BufferedReader) usually maintains a buffer of data to read, and the JVM can only read the data one-at-a-time, which could be a long wait for the underlying OS. The solution to this problem is to use the unbuffered-InputStream or Reader classes in the Java library, which allows the JVM to quickly read the data from the file, rather than waiting for the OS to read the data in the buffer. Description: The purpose of this article is to introduce you to the Java I/O Tutorial. This tutorial is intended to help the novice Java programmer understand the basics of writing an I/O-based application in Java. The tutorial focuses on the reader class and the use of
