Although multiple evidence-based pharmacotherapies are now available, gaps exist in our knowledge regarding how to optimize pharmacotherapy in these patients. For example, currently-approved disease-modifying antirheumatic drugs (DMARDs) for JIA are prescribed based on limited evidence with respect to how to optimize their use. Children with rheumatoid factor (RF)-positive polyarticular JIA (pJIA) are among those with JIA in whom prognosis is the best and can be improved if the disease is brought into clinical remission. Unfortunately, DMARDs are primarily effective in reducing arthritis activity in pJIA, but not in RA and in one study suggested they were less effective in RF-positive pJIA compared to RF-negative pJIA. Given the increasing complexity of the treatment options for patients with JIA, there is a pressing need to understand how best to optimize the use of therapy. While providing care for patients with JIA, clinicians are likely to use a combination of pharmacotherapy and non-pharmacological strategies to optimize outcomes. Although several non-pharmacological interventions are available for patients with JIA, including joint injections, occupational and physical therapy, and psychosocial strategies, the evidence for how best to integrate these with pharmacotherapy is limited. Therefore, in this project we will address the knowledge gap regarding how to optimally use DMARDs to best improve disease-specific outcomes in children with JIA. With a unique combination of data linkage, observational study and parent-reported outcome (PRO) measures, this work will provide essential knowledge regarding how to best optimize pharmacotherapy for patients with JIA./* Copyright (c) 2008-2009 NetAllied Systems GmbH This file is part of COLLADAFramework. Rachel Heathcoat-Amory Rachel Heathcoat-Amory (October 15, 1856 – February 28, 1939) was an American artist. She was the painter of the Darwin portrait that hangs in a permanent exhibition at the National Portrait Gallery. Early life and education Rachel Heathcoat-Amory was born in Mendham, New Jersey, the daughter of Susan A. Phelps (1829–1894) and Samuel Amory (1831–1898). She graduated from The High School of Baltimore with a gold medal in 1875 and from the Miss Stuyvesant's School with a gold medal in 1877. Career As a young woman, she spent much of her time in the United States and, later, abroad. From 1878, she worked in Spain for four years. She returned to the United States in 1882, where she continued to paint portraits for some time. During this time, she was affected by the death of her brother Daniel, who died in 1883. Her brother's death had a strong effect on her art, and she later said she had learned to paint while she was mourning her brother. She settled in New York, where she rented a small studio at 64 East 23rd Street for many years. There she painted portraits, portraits of children, and landscapes. She also copied paintings, and sold some of her works. She received commissions from the Child Welfare League, the Immigration League of New York, the United States War Department, and the New York City Board of Education. Darwin She painted the portrait of Charles Darwin, which hangs in the National Portrait Gallery, from an 1885 pencil outline. Her subject had nothing to do with Darwin's theory of evolution, as she explained, but f30f4ceada
