mechanical parts, architectural and civil engineering designs, electrical schematics, and more. Features AutoCAD comes with a large set of standard tools that are useful for many types of CAD drawings. Some examples include: Drafting and drawing tools for creating views and laying out designs. Tools for creating orthographic and perspective views. Tools for working with layers, including the ability to hide and lock objects on a layer. Tools for managing object properties, including scaling and rotating. Tools for aligning objects relative to one another, for example, by creating a baseline or center line. Tools for editing existing drawings, including cutting and pasting. Tools for viewing drawings in a slide show. In addition to these tools, AutoCAD comes with a variety of specialty tools and a large library of objects that are useful for creating a variety of

different types of drawings. Two Specialty Tools Subpackages Subpackages are AutoCAD's way of selling add-ons and other customization to the user. AutoCAD has a large range of subpackages, including: Standard Subpackages, which are standard additions that can be purchased with AutoCAD at the time of installation and are not custom made for the specific user. The 2010 version introduced a feature called Dynamic Input which is used to get an input via the Live Streaming technology, where the drawing content is not known in advance.

Various scripting languages are available in the Autodesk plugin environment: AutoLISP, which is used by the integrated drawing engine is available in AutoCAD LT. It is not available in AutoCAD. AutoLISP is a legacy language and is poorly supported in later versions of AutoCAD. Visual LISP which is a Visual Studio language and runs in a Windows Forms application. programming interface (API) and interactive development environment. Programming languages AutoCAD supports over 50+ programming languages. The most widely used programming language supported by AutoCAD is AutoLISP, used for scripting with the integrated drawing engine. AutoLISP was first introduced with AutoCAD 3D. It is similar to BASIC, and is primarily a declarative language. Like BASIC, it can be used for some types of programming, but lacks the imperative side that many programming languages have. For this reason, it is not commonly used for code that must execute without user intervention. AutoLISP is included in AutoCAD LT. It is deprecated and will not be available in future releases of AutoCAD. AutoLISP, which is still supported, was also the development base for: AutoCAD Architecture AutoCAD Electrical AutoCAD

### About the new shading model

The new shading model in AutoCAD enables you to assign a color to every cell of a model, and use that color to shade that cell. You can assign colors to cells quickly and easily with the new color wheel palette. You can easily bring out of the shade the color you want to display by clicking the color. The new shading model is designed to allow for more precise control over shading effects, which can be advantageous in some circumstances. Be careful if you're shading a detailed model such as a plant or an item that has a lot of shading detail. While the new shading model can yield great results, it can also produce some unexpected effects. For example, it might be easier to shade the area of

a leaf in blue if it has a little red next to it, but blue shading can appear on the leaf if there is red next to it, too. The new shading model also introduces several new settings: Shading Preferences. You can modify how the shading model applies shading. You can modify how the shading model applies shading.
