Note You may want to buy Photoshop Elements if you're a beginner. You still get most of the features in Elements, and it's much cheaper at around \$100. If you're going to use Photoshop for basic photo editing, your first step is to download the program to your computer. You can buy a copy at the Adobe site (www.adobe.com) or download a trial version. Figure 3-1 shows Photoshop and the options that are available on the Tools Format pull-down menu. Here are the steps you need to take to get started: 1. **Open an image file.** You should find most any type of image file in the folder where Photoshop is installed. It could be a JPG, JPEG, TIFF, GIF, BMP, or other file. The easiest way to open an image is through the menu. 2. **Choose the Tools Format=>Photoshop=>Open dialog box.** 3. **Select Photoshop from the pull-down menu that says Open.** 4. **Click the Open button.** You see the image file open in Photoshop. If you wanted to change the type of file that Photoshop opens, you can do that by choosing Tools Format=>Photoshop=>File Type. This menu lets you choose from a selection of file types for opening a photo. FIGURE 3-1: Open an image using the Tools Format dialog box, as shown here. 5. ***(Optional) Click inside the blue box in the upper-left corner to view your image in the Photoshop window; click again to return to the Tools Format dialog box.**

Photoshop is becoming increasingly indispensable for most digital creators. The only way to properly edit your photos and other media, is to use Photoshop, by integrating it into your workflow. This also means using a collection of ad-hoc apps to edit your media, because it is far easier to manage a collection of apps than a collection of files. This is due to the fact that when you are working on a photo, you need to use several apps to process it, and if you need to access that photo again, you need to remember where you have it stored or you will have to re-download the file. The main reason for this is that you often need to perform operations at the same time as editing. For example, you might want to apply a particular filter or lens effect to your photo, or you might want to add a text caption. Editing a photo usually takes more time than it takes to perform a particular task, such as adding a filter. So, if you are just about to start a new photo editing job, you might want to start a new document first, and then add text or a logo to the new photo at the same time. This way, if you are not sure whether you want to edit a photo in RGB (red, green and blue) or in CMYK (cyan, magenta, yellow and key) color modes, you could go back to the original photo and decide at the end of the process. In the following list, we detail all the popular Photoshop apps that photographers and creative professionals can use to edit and manipulate images. You can also expand the list, filtering the apps by Photoshop Elements, Lightroom, or other photo editing apps. 1. Adobe Photoshop Adobe Photoshop is one of the most popular photo editing apps in the world. Photoshop is a true workhorse and it is the biggest player in the photo editing world. Adobe Photoshop is easy to use, providing a complete range of tools, from basic editing capabilities to complex retouching and professional-grade design. Adobe Photoshop is also one of the best graphic design apps, as it allows creative professionals to use its powerful tools to manipulate a range of elements, including fonts, images, colors, shapes, and videos. Moreover, it includes a range of advanced Photoshop effects for creating unique images, animated GIFs and time-lapse videos. It is also the biggest player in photo retouching. Photoshop is probably the most used photo 05a79cccf

Q: AttributeError: 'NoneType' object has no attribute 'sort' I have a list of tuples that I want to sort and put it into a data frame by elements of the tuples. But I keep getting error (shown below), I don't see where I'm going wrong. Thank you. import numpy as np import pandas as pd list = [(("a",1),("b",2),("c",3),("d",4))] df = pd.DataFrame(list) df.sort(key=lambda x:x[1]) I get the error AttributeError: 'NoneType' object has no attribute 'sort' A: The error is self-explanatory, list is a list of tuples and not a dataframe. You have to convert the list of tuples to dataframe first. list = [("a",1),("b",2),("c",3),("d",4)] df = pd.DataFrame(list) df = df.sort(key=lambda x:x[1]) output 0 1 0 a 1 1 b 2 2 c 3 3 d 4 [Arthrography and aseptic locking of large joints. Preliminary results in cows]. Preliminary results are presented following arthrography in 11 dairy cows and arthroscopy in 2 cows with large erosive synovitis of the stifle. In the first group, injection of a contrast medium into the synovial cavity could be performed directly following arthrography in 10 cows. Other examinations of the joint could be performed simultaneously with a plain film of the stifle. This was found to be a simple and fast alternative to joint punctures, as well as to the necropsy examination of the joint. The histopathologic and radiological examinations of the joint after the arthrography supported the diagnosis of an inflammatory synovitis. The second cow with arthroscopy, which was performed following arthrography, demonstrated the advantages of this combination of examinations. Beat olympics Today we are announcing the

In a world where there is more information than time, where your business gets more attention than you, where you struggle to get your message out and your brand to make an impression, data analytics can be the tool that helps you make the connection. Our approach to business analytics is fundamental, starting with the user and working outwards. It allows for a deeper understanding of the user than just knowing their preferences and needs. It also allows us to examine the ways in which your businesses, services or products form an ecosystem that should be optimised and then measure if that is the case. Through our approach, data can help create a more coherent view of your brand and business. When you look at your data objectively, you can measure the connections that exist between your activities and operations. And when you can measure these connections, you can make better decisions and promote new products. Data Analytics At the end of the day, your brand is a combination of everything that you do or don't do in your business. But most companies keep a lot of this information inside spreadsheets and emails that are mostly useless. It's our job to take it all in and make the best decision for your brand by helping you find connections and hidden insights. Analytics isn't just about big data, in fact, it can be small data that you don't realise you're collecting. One example of this is the amount of social media likes you have or the number of tweets you have sent out in the last week. If you never do any of the above, then it's worth keeping track of and analyzing the data you might be collecting. You'll get a better understanding of the people who interact with your brand and a better insight into how they want to be marketed to. Data analytics is also applicable to how you operate. For example, a business that thinks it can get away with the bare minimum in terms of investment and resources, will face the consequences later on, because it will eventually put itself out of business. Analytics can help you avoid that, because it gives you the chance to look at your business, from the most fundamental level, in order to ensure that you're meeting your customer's needs. At Datahive, we use analytics to help your brand become more coherent, less confused and more relevant. Our approach starts with your clients and develops with your business, because we understand that data grows, but
