It retains the same features as the previous version, including the powerful selection tools and the many different filters, color correction options, and layer-based editing. Photoshop's changes introduced in recent releases have not, in and of themselves, been major. However, with the introduction of features such as updated skin-tones controls, the capture of edge information that's blended with a more mathematically-based approach to setting color, advanced retouching capabilities for removing the previously needed "posterization," and a new way of editing color using dialog boxes that can produce the same results as the previous palettes, Photoshop has changed enough that even the new users will find these changes exciting. If you're the advanced user already, the most change in Photoshop CC 2019 will give you more control over color, including the ability to use Photoshop's new photo-friendly spot colors without saving any special configurations. This book focuses on Photoshop CC 2019, with a separate chapter on Photoshop CS6 and CS6 Extended for much of the reference material already found online. [Anatomical relation of the frontal branch of the facial nerve to the buccinator muscle. A morphological and clinical study]. The buccinator muscle is often mistaken for a tumour when it surrounds the frontal branch of the facial nerve. The proximity of this muscle explains the marked clinical manifestation in this area, described as "Tumefaction buccinator". This condition is diagnosed by ultrasonography or magnetic resonance imaging. The main task of this study was to differentiate the buccinator muscle from other, often malignant, tumours. This retrospective study included 22 formalin-fixed and paraffin-embedded buccinator muscle specimens taken during dissection in a routine anatomical laboratory over a 5-year period (1998-2003). Twenty-two buccinator muscles were harvested; six of these specimens were associated with a tumour. Two distinct morphological types were observed on haematoxylin-eosin staining. The most frequent type (10/22) was a normal, focally dilated buccinator muscle. The second type was the pre-tumoral process where the buccinator muscle displayed a sclerosed muscular fascicle. Twenty-two of the 22 buccinators were associated with fibrous bands passing between them and the buccinator muscle was uninvolved. Twenty of 22 buccinators were consistently attached to the skin and the other two had no definite attachment. This method of dissection involving the full thickness of the facial nerve can provide excellent access to the buccinator muscle. However, it permits verification of a buccinator muscle origin that is not often associated with the nerve. Arthroscopic subacromial decompression and acromioplasty using the telediastinal approach. The purpose of this study was to show that arthroscopic subacromial decompression and acromioplasty performed using the telediastinal approach with a subacromial decompression needle ensures prompt and effective treatment and a high level of patient satisfaction. The study comprised 100 patients (97 shoulders) with confirmed pathological and symptomatic impingement syndrome. No patient was treated with the telediastinal approach alone. The patients were examined preoperatively and at 1, 6, and 12 months postoperatively. The median duration of symptoms at the time of surgery was 4 months. The median duration of the follow-up period was 1 year. The mean patient age was 43 years (range, 20-59).
